Better isolation in buildings based on the usage of modern building materials and building methods creates barriers for heat and radio rays. This leads to reduced radio reception inside building complexes. In order to prevail over this challenge, ErvoCom offers you the possibility to install an in-house supply.

Figure: In-house supply GSM/UMTS/LTE/TETRA/DMR/Polycom

In a growing number of buildings it becomes hardly impossible to make calls and enjoy fast data transfer with your mobile phone. At the same time, claims for security, reachability and fast response times constantly increase. With our planning and realization of an in-house supply you get the best possible radio coverage of your property.

Via repeaters in combination with outside as well as inside antennas, we supply you with radio signals of all mobile network providers inside your buildings. Thereby, we care for an optimal reachability on your mobile device.

In addition to GSM, UMTS and LTE we provide the same services in digital mobile radio (DMR), TETRA and Polycom (Tetrapol) technologies. We are looking forward to come up with an ideal solution for your property, together with you. Please do get in touch with us.

Advantages

- Complete radio coverage in security-critical rooms
- Make calls without any interferences
- Higher reachability inside buildings and in basements
- Improved response times for calls
- Low Maintenance costs
